ClosedXML is a .NET library that enables users to read, manipulate and write Excel files. The idea behind the library is to provide an interface for dealing with the underlying tricky OpenXML API. The application is compatible with early versions of Excel 2007 and works with the newest releases as well. On the other hand, developers can manipulate the files without having to have Excel installed on their system. It is important to note that the library is not thread-safe and hence, there is no guarantee that parallel operations would work. The utility comes with vast documentation and provides scenarios with the most likely situations, so users are advised to check the FAQ out. For example, a common situation is when the text with numbers is converted to numbers. The reason behind this is that when the value property of a cell is set, the app calls the ToString() method of the object and hence, interprets the value as a number, date, time stamp, boolean or text. Users who want to insert a number as text can address this issue by changing the cell's data type to text, setting the cell's format to "@" before setting the value or prepending a single quote character, like cell.Value = "'123", for instance. Regards, Rudy Rudi Dizdarevic 03-03-2012, 05:13 PM Hi Rudy, good tutorial and extremely helpful. Be careful to change cell type before setting value if you are trying to save the file as.xlsx, as we are talking about older versions. Thanks! Rudy Dizdarevic Chocapowder 03-03-2012, 08:24 PM I found this really helpful, but I have a question about working with old Excls. There are 2 instances where I need to manipulate an older Excel file that won't work with ClosedXML. 1) Saving the file as.xlsx I found that if I save the file as.xlsx using ClosedXML it makes it impossible to open. 2) Changing from cell.Value to cell.Text If I change the cell.Value property to cell.Text, it will make the file invalid for opening and users won't be able to work with it. I need to be able to work with cell.Value or use the cell.NumberFormat, cell.Formula, cell.CustomProperties, cell.SharedFormula, cell.Value2, cell.HasFormula, etc. Is there any way around this? Rudy Dizdarevic 03-03-2012, 08:37 PM You can open it and save it as.xls and it should work. Chocapowder 03-03-2012, 08:41 PM Thank you for your reply. Now I have a couple more issues. 3) Using Range.Replace It seems that if I set a cell's Value to be cell.Text, then I can't use Range.Replace to remove a row. In a situation where I have a bunch of cells that are formulas, I need to remove those cells because they are no longer needed. Range.Replace won't let me remove cells that 09e8f5149f
