User Types AutoCAD software is designed to run on Windows, OS X, Linux, and other common operating systems. The AutoCAD software comes in several different versions that address different user types and workflow. Drawing: The CAD users who draw everything from floor plans to engineering models and drawings of construction sites and equipment. Drafting: The CAD users who draft everything from architectural and civil engineering designs to technical blueprints. 2D Drafting: This tool is most commonly used in architectural and engineering professions for drawing technical drawings, architectural drawings, and schematic designs. 2D Drafting is equivalent to AutoCAD's Drafting workspace. 3D Drafting: These users create plans, design models, and drawings for architectural and engineering designs. 3D Drafting is equivalent to AutoCAD's 3D Drafting workspace. Package: These users create complete architectural or engineering projects and use related computer tools to make them. Package users create project files that can be used with other packages or AutoCAD's Architecture or Engineering packages. Site: This user creates and manages construction sites. Site work is created in a Site workspace that is designed to handle the unique features of site-based drawing and design. The following table explains the differences between each AutoCAD user type. It also includes a range of tools for design specification of building construction. Environmental Designer provides a range of tools for the design of building envelopes, plan-view thermal environments and MEP control systems. It can produce multiple views of any building model, including section and elevation views. Construction Design Suite for Architecture provides design tools for building construction and construction management. It includes a Building Information Modeling Tool for design and documentation of buildings and their interiors, as well as a Building Information Modeling Tool for 3D visualisation of building models. Construction Design Suite for Architecture includes the following products: The Dassault Systemes SolidWorks family of products, ranging from 2D and 3D CAD to product design and construction engineering, is the key manufacturing- and systems-design software of Dassault Systemes. SolidWorks software for the automotive industry has been developed in conjunction with key German automotive manufacturers. The Dassault Systemes Fusion family of products, including CAD, CAE and collaboration tools, is the key enterprise solutions for the BFSI and manufacturing industries. Fusion products include: The systems application of the Dassault Systemes family is the Dassault Systemes VisIt system, which is used to view visualization data from simulations of the nuclear industry, such as the Fukushima Daiichi nuclear disaster. BIM Building Information Modelling is a tool for visualizing building design and construction data. Building Information Modeling is based on the building information modelling (BIM) workflow, an iterative process that links design, construction and operations. Building Information Modeling can be integrated with other products, including visualizations, for construction documentation. Dassault Systemes offers several Building Information Modeling products. They include: Building Information Modeling starts in the modelling phase, as a tool to develop the 3D model. In the construction phase, it can serve as a visualisation tool for the construction project and a tool for interaction. The Dassault Systemes Systemes CoreEngine product offers functionality for building information modelling: Projects with a design build construction (DBC) approach typically employ Building Information Modeling.
