A lightweight software application designed specifically for helping you generate water caustics textures. Its aim is to simulate the effect of light refracting through water and render images which can be used in real-time graphics, such as games and simulations. What's more, the generated water surface is tileable, which means you can tile individual images both

horizontally and vertically, while an animation sequence loops in time. The advantages of being portable Since this is a portable program, it is important to mention that it doesn't leave any traces in the Windows Registry. You can copy it on any USB flash drive or other devices, and take it with you whenever you need to render caustics light patterns on the breeze, without having to go through installation steps.

Configuration settings Caustics Generator gives you the possibility to alter several caustic parameters pretty easily, thanks to the built-in sliders, namely depth, intensity, amplitude, frequency, and time. The current settings can be exported to CST file format, so you can quickly upload them in your future projects. What's more, you are allowed to enter a user-defined number of frames, specify the size of the

image (up to 512x512), alter the background color based on the RGB values, automatically preview the changes applied to the image in a dedicated panel, pick the saving directory, as well as export the water caustics texture to BMP file format. Bottom line All in all, Caustics Generator comes bundled with a handy suite of features for helping you create caustics light patterns with minimal effort. If you

are looking for advanced options, such as commercial use, animation playback and tiling preview, motion blur, high dynamic range image output (EXR), fast rendering of animations on multi-CPU computers, surface height and normal map output, and unlimited image size, you may check out the professional version of the program, which can be found here. Luminance Noise What is Luminance Noise?

Luminance Noise or simply Noise is a technique where you take a noisy image, add an array of noise, and then subtract this from the original image and you get a different image that is new, and hopefully more pleasing. The result of all of this is a result of adding texture to a scene. It also has the benefit of a visually pleasing result which people have been using for years to add a nice look to their scenes.
