The pathogenesis of cardiac hypertrophy involves alterations in several hormonal and endogenous metabolites that regulate the heart's ability to maintain steady blood flow. Current evidence indicates that the cardiac metabolome contains a distinct signature of reduced insulin sensitivity in hypertrophy, specifically in the heart's response to systemic insulin, which was not seen in other tissues. Preliminary data further suggest that increased circulating levels of branched chain amino acids (BCAA's) may contribute to the reduced cardiac response to systemic insulin. These findings suggest that the insulin resistance of hypertrophy might involve alterations in the heart's metabolism of BCAA. The central hypothesis of this proposal is that hypertrophy is characterized by a unique pattern of heart-specific changes in BCAA metabolism that is reflected by altered regulation of the cardiac L-type Ca²⁺ channel, and is associated with changes in insulin sensitivity. We propose to combine state-of-the-art mass spectrometry to interrogate the cardiac metabolome and in vivo techniques to assess BCAA metabolism with electrophysiology and in vivo cardiac function in hypertrophy. We will compare changes in cardiac metabolites (Specific Aim 1), BCAA metabolites (Specific Aim 2), and cardiac L-type Ca²⁺ channel regulation (Specific Aim 3) in two classes of hearts: (i) in a rat model of type 2 diabetes/hypertrophy with impaired cardiac insulin signaling and glucose metabolism; (ii) in a rat model of type 1 diabetes/hypertrophy with an intact insulin signaling pathway. There are two major goals. First, we will establish that a class of hypertrophy is characterized by impaired insulin signaling and will determine whether BCAA metabolism is associated with this change in insulin signaling. Second, we will establish that there is an altered pattern of insulin action on cardiac L-type Ca²⁺ channel regulation in hypertrophy; and that the changes in BCAA metabolism are associated with this altered insulin action. Results of this work will aid in the development of new therapeutic approaches to prevent or ameliorate the progression to heart failure by either reducing oxidative stress or correcting the metabolic profile of the failing heart.package org.hexworks.zircon.api.interfaces.event import org.hexworks.zircon.api.testutils.TestCase class WidgetPluginEventTest : TestCase() { private val wpEvent0 = WidgetPluginEvent(WidgetPluginKey("widget-plugin-0", 0))

Seat-belt use by older adults: incidence of low-back pain and factors influencing compliance. To assess the incidence of low-back pain in older adults using a seat-belt, and to evaluate the influence of subjective and objective symptoms on seat-belt use. Cross-sectional. An eastern Canadian community. A random sample of older adults (n = 991) aged 60-85 years who volunteered to participate in the study. Postal survey. Three hundred and forty-nine responses were received: 130 (36%) were men and 219 (64%) were women. Thirty-nine (11%) of the participants reported the experience of back pain in the past 12 months. Seventeen per cent of the participants reported, or were shown to have, evidence of present low-back pain. Only 31 per cent of the participants used the seat-belt regularly. The use of a seat-belt was significantly related to lower-back pain, a positive history of back pain, and lower back function. Individuals who reported low-back pain were less likely to use seat-belts. They were more likely to use a knee-belt, they had a greater likelihood of experiencing a history of back pain, and they had a lower perceived susceptibility to back pain. Interventions to encourage older adults to use their seat-belts are needed. In addition, there is a need to examine the effectiveness of messages and instructions designed for older adults. What does it mean to say that the work of Jesus is still in progress? Who is the enemy that opposes us, pursues us, or presses upon us? Jesus has accomplished everything for us. All our needs and all our problems are answered in him. All our judgments and all our purposes for living are destroyed in him. He is our source of life and our eternal hope. He is our truth and our righteousness. But what does it mean for us to know that "the work of Jesus is still in progress"? What does it mean for us to have to fight a battle to know this and to keep on searching for the rest that he has left for us? There are two answers to these questions. 1. We cannot know that the work of Jesus is still in progress until we have acknowledged that the kingdom of God is our own. When we consider that the kingdom of God is our own, that we have a sovereign God who makes his own the afflictions and trials of our lives, then we are forced to come to the conclusion that the work
