Substitution effects constitute a key concept to understand... for the stability order of carbocations (Brown , Iverson, Anslyn, & Foote, 2013; ... As an example, we will consider a cation containing two water molecules, and we will assume that all water molecules that make up this cation have the same valency. If we did not take into account the effects of substitution in the system, then we could argue that there are two water molecules in this cation exchanger, because in this case there is only one anion. However, since two anions can be dissociated into different cations with different valences, this is not the case. dd2bc28256
