I'm always excited for new features in Photoshop. And I'm always pleased and surprised when a dramatic performance improvement (or a small bug fix) is released. But I have to give them credit. Photoshop is a wizard at simplifying complexity. The newest version is a huge improvement over the last one. There are a few methods you can open Photoshop document, you can make it possible to open Photoshop documents that are opened in the PDF format. This will allow you to edit these files just as you would edit your own PSD or PDF files; but instead of Photoshop you will open PDF files using a third-party viewer such as Adobe Photoshop Elements or Adobe Reader. Unless you are very experienced in downloading software, the best way to transfer your files to a new computer (or you accidentally delete one) is just to transfer them in the original folder that contains your file. This includes your Photoshop selection layers, paths, active selection, clipping masks, channels, and data. Photoshop will reclaim all this content automatically upon opening on the new computer. In addition, if your original computer is without a hard disk, download it to a portable drive. It will be easier to save the files with Photoshop, even if you were to just go to a network share. It is not recommended to use a card reader, also loaded with Photoshop (or any other file). If you don't mind paying the day it's released, you can purchase the upgrade alongside the product you purchase. You must register on your Mac or PC first (or check the respective Insider Notebook) in order to log in that computer and then purchase for that particular computer.
